wide range of output pulse widths from the Q and  $\bar{Q}$  terminals. The time delay from trigger input to output transition (trigger propagation delay) and the time delay from reset input to output transition (reset propagation delay) and the time delay from reset input to output transition (reset propagation delay) are independent of  $R_X$  and  $C_X$ . Leading edge triggering (+TR) and trailing edge triggering (-TR) inputs are provided for triggering from either edge of an input pulse. An unused +TR input should be tied to  $V_{SS}$ . An unused -TR input should be tied to  $V_{DD}$ . A RESET (on low level) is provided for immediate termination of the output pulse or to prevent output pulses when power is turned on.

DESCRIPTION

The CC4098 is a monolithic integrated circuit fabricated in Metal Oxide Semiconductor technology available in DIP and SOP packages. The CC4098 dual precision monostable multivibrator provides stable retriggerable/resettable one-shot operation for any fixed voltage timing application. An external resistor ( $R_X$ ) and an external capacitor ( $C_X$ ) control the timing for the circuit. Adjustment of  $R_X$  and  $C_X$  provides a

## CC4098

An unused RESET input should be tied to  $V_{DD}$ . However, if an entire section of the CC4098 is not used, its reset should be tied to  $V_{SS}$  (see table 1). In normal operation the circuit triggers (extends the output pulse one period) on the application of each new trigger pulse. For operation in the non-retiggerable mode,  $\overline{Q}$  is connected to -TR when leading edge triggering (+TR) is used or Q is connected to +TR when trailing edge triggering (-TR) is used. The time period (T) for this

### INPUT EQUIVALENT CIRCUIT

multivibrator can be calculated by:  $T = 1/2 R_X C_X$  for  $C_X \geq 0.01\mu\text{F}$ . The min. value of external resistance,  $R_X$ , is  $5\text{K}\Omega$ . The max. values of external capacitance,  $C_X$ , is  $100\mu\text{F}$ . The output pulse width has variations of  $\pm 2.5\%$  typically, over the temperature range of  $-55^\circ\text{C}$  to  $125^\circ\text{C}$  for  $C_X = 1000\text{pF}$  and  $R_X = 100\text{K}\Omega$ . For power supply variation of  $\pm 5\%$  typically, for  $V_{DD} = 10\text{V}$  and  $15\text{V}$  and  $\pm 1\%$  typically for  $V_{DD} = 5\text{V}$  at  $C_X = 1000\text{pF}$  and  $R_X = 5\text{K}\Omega$ .
